Merging and Joining Data Sets

Data Wrangling in R

Joining

"Combining datasets"

Joining in dplyr

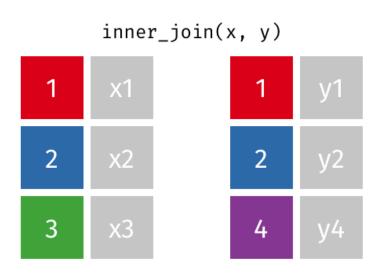

- Merging/joining data sets together usually on key variables, usually "id"
- · ?join see different types of joining for dplyr
- inner_join(x, y) only rows that match for x and y are kept
- full_join(x, y) all rows of x and y are kept
- · left_join(x, y) all rows of x are kept even if not merged with y
- right join(x, y) all rows of y are kept even if not merged with x
- anti_join(x, y) all rows from x not in y keeping just columns from x.

Merging: Simple Data

2 Alaska 0.623

Inner Join

Left Join

Install tidylog package to log outputs

```
# install.packages("tidylog")
library(tidylog)
left join (data As, data cold)
Joining with `by = join by (State) `
left join: added one column (April vacc rate)
> rows only in x 1
> rows only in y (1)
> matched rows 1
> ===
> rows total 2
\# A tibble: 2 × 4
  State June_vacc_rate May_vacc_rate April_vacc_rate

    <dbl>

    0.516

    <dbl>

    0.514

  <chr>
                                                    \overline{<}dbl>
1 Alabama
                                                 NA
                                  0.626 0.623
2 Alaska 0.627
```

Right Join

https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/right-join.gif

Right Join

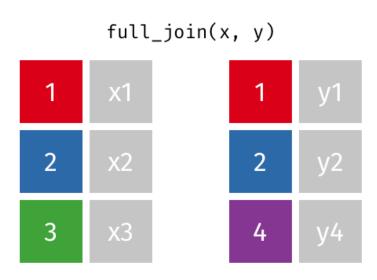

```
rj <- right join(data As, data cold)</pre>
Joining with `by = join by (State) `
right_join: added one column (April_vacc_rate)
> rows only in x (1)
> rows only in y 1
> matched rows 1
> ===
> rows total 2
rj
\# A tibble: 2 × 4
 State June_vacc_rate May_vacc_rate April_vacc_rate
            <chr>
            0.627 0.626
1 Alaska
                                        0.623
2 Maine NA
                                        0.795
                          NA
```

Left Join: Switching arguments

```
lj2 <- left join(data cold, data As)
Joining with `by = join by (State) `
left join: added 2 columns (June vacc rate, May vacc rate)
> rows only in x 1
> rows only in y (1)
> matched rows 1
> ===
> rows total 2
1j2
\# A tibble: 2 × 4
 State April_vacc_rate June_vacc_rate May_vacc_rate
           <chr>
             0.795 NA
1 Maine
2 Alaska 0.623 0.627 0.626
```

Full Join

https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/full-join.gif

Full Join

```
fj <- full join(data As, data cold)
Joining with `by = join by(State)`
full_join: added one column (April_vacc_rate)
> rows only in x 1
> rows only in y 1
> matched rows 1
> ===
> rows total 3
fj
# A tibble: 3 \times 4
 State June_vacc_rate May_vacc_rate April_vacc_rate
             \overline{<}dbl>
<chr>
             0.516 0.514
                                       NA
1 Alabama
2 Alaska
             0.627 0.626
                                       0.623
3 Maine NA
                      NA
                                        0.795
```

data As

```
lj <- left_join(data_As, data_cold)

Joining with `by = join_by(State) `
left_join: added 2 columns (vacc_rate, month)
> rows only in x 1
> rows only in y (1)
> matched rows 2 (includes duplicates)
> ===
> rows total 3
```

Data including the joining column ("State") has been duplicated.

1 j

Note that "Alaska willow ptarmigan" appears twice.

https://github.com/gadenbuie/tidyexplain/blob/main/images/left-join-extra.gif

left_join(x, y)			
1	x1	1	y1
2	x2	2	у2
3	х3	4	у4
		2	у5

Stop tidylog

unloadNamespace("tidylog")

Using the by argument

By default joins use the intersection of column names. If by is specified, it uses that.

Using the by argument

You can join based on multiple columns by using something like by = c(col1, col2).

If the datasets have two different names for the same data, use:

```
full_join(x, y, by = c("a" = "b"))
```

Using "setdiff" (base)

We might want to determine what indexes ARE in the first dataset that AREN'T in the second:

```
data As
# A tibble: 2 \times 2
 State state_bird <chr> <chr>
1 Alabama wild turkey
2 Alaska willow ptarmigan
data cold
\# A tibble: 3 \times 3
  State vacc rate month
3 Alaska 0.626 May
```

Using "setdiff" (base)

Use setdiff to determine what indexes ARE in the first dataset that AREN'T in the second:

```
A_states <- data_As %>% pull(State)
cold_states <- data_cold %>% pull(State)

setdiff(A_states, cold_states)

[1] "Alabama"

setdiff(cold_states, A_states)

[1] "Maine"
```

Using bind_rows()(dplyr)

0.795 April

0.623 April

0.626 May

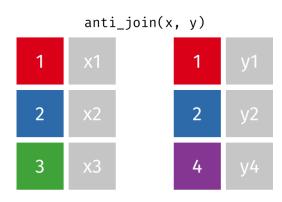

3 Maine <NA>

4 Alaska <NA>
5 Alaska <NA>

Rows are stacked on top of each other. Works like rbind() from base R, but is "smarter" and looks for matching column names.

Other stuff: anti_join (dplyr)

https://raw.githubusercontent.com/gadenbuie/tidyexplain/main/images/anti-join.gif

Other stuff: cross_join (dplyr)

Cross joins match each row in x to every row in y, resulting in a data frame with nrow(x) * nrow(y) rows.

```
cross_join(data_As, data_cold)
```

```
# A tibble: 6 × 5
State.x state_bird State.y vacc_rate month
<chr> <chr> <chr> 1 Alabama wild turkey Maine Alaska Wild turkey Alaska O.623 April
3 Alabama wild turkey Alaska O.626 May
4 Alaska willow ptarmigan Maine O.795 April
5 Alaska willow ptarmigan Alaska O.623 April
6 Alaska willow ptarmigan Alaska O.626 May
```

Other stuff: nest_join (dplyr)

A nest join leaves x almost unchanged, except that it adds a new column for the y dataset. Matched values are stored inside the "cell" as a tibble.

Other stuff: nest_join (dplyr)

Summary

- Merging/joining data sets together assumes all column names that overlap
 - use the by = c("a" = "b") if they differ
- inner join(x, y) only rows that match for x and y are kept
- full_join(x, y) all rows of x and y are kept
- · left_join(x, y) all rows of x are kept even if not merged with y
- right_join(x, y) all rows of y are kept even if not merged with x
- Use the tidylog package for a detailed summary
- setdiff(x, y) shows what in x is missing from y
- bind rows(x, y) appends datasets

Extra slides

"Includes duplicates" with both datasets duplicated:

"Includes duplicates" with both datasets duplicated:

```
full join (data As, data cold)
Joining with `by = join by (State) `
Warning in full join (data As, data cold): Detected an unexpected many-to-many relationship between `x` and `y`.
i Row 2 of `x` matches multiple rows in `y`.
i Row 2 of `y` matches multiple rows in `x`.
i If a many-to-many relationship is expected, set `relationship = "many-to-many" ` to silence this warning.
# A tibble: 6 \times 4
